>>>>>>> 01 Introduction

IT security plays a vital role in protecting critical information assets. Nowadays, Security Information and Event Management are widely used to provide an integrated picture of the enterprise security infrastructure comprising all types of security tools and devices.

Log Radar is a security management tool designed to empower its users to manage security logs efficiently as well as appreciate their network health posture instantly via graphical visualization of threats, anomalies and existing trends.

- 24x7 Dedicated Technical Support Certified Security Professionals
- Innovative R&D Team
- Regional Security Experiences
- Localized Presence
- Customizable Solutions

03 Most responsive SIM tool available today

Log Radar assists the often tedious security management by specifically delivering a clear, comprehensive, uncluttered enterprise picture of the security condition in real time! Designed to fit most network security environment, Log Radar allows security rules and policies to be set up flexibly and specifically tailored for your business priorities and objectives. In the event upon detection of threats or violations, you will instantly be alerted and informed by Log Radar.

Automatic and Secure Logs Archiving

Log Radar eases the archive management task by automating the process with a built-in scheduler and output files that are compressed and encrypted, for safer storage and convenient retrieval. You rest assured knowing your risk is reduced and will be well prepared for any audit and forensic requirements.

04

Advanced Asset Correlations

Log Radar is able to classify each security event in real-time and instantly pinpoint the physical location of an asset or business processes it secures. This allows you to produce "readable" high-level management reports and construct rules based on the asset and its location. You are able to give speedy response to any security alert generated from specific information such as, the exact location, business unit, critical servers, user name, network segment, asset and many other requirements.

05

Asset Discovery & Knowledge Base

Exceptional supporting features include an Asset Discovery tool to detect all devices in the network for foreign or unauthorized connections. This tool also notifies the administrator if all familiar devices are online.

The Knowledge Base is a comprehensive reference for better log management. A simple but powerful search engine brings up entries with relevant keywords and a wealth of information for identifying any unfamiliar log entries.

06

“With Log Radar, organizations will save dramatically on the time and resources spent monitoring ICT security postures”

- Mark Hymczak, Quality Assurance Lead, TecForte-

02 Pro-active Security Intelligence Solutions

Log Radar provides you with a centralized security management console to track your security events throughout your enterprise security infrastructure. Its robust normalization and correlation engines are able to process massive amount of security information and cryptic codes - generated by wide array of disparate security devices - into a clear, easy-to-understand report.

The intelligent platform enables organizations to prioritize and respond to threats affecting their computer networks quickly and accurately - Log Radar makes complex security management simple!
